

Web and Navigation Design

Department of Computer Science | Software Requirements and Design
Marta Kristín Lárusdóttir, associate professor
30 September, 2019

www.ru.is

Overview:

- Design Principles Revisited
- Web design
- Navigation design

- Reading
 - ID book 1.7.3, 7.2.2, 7.2.5,

www.ru.is

Design principles

- Generalizable abstractions for thinking about different aspects of design
- The do's and don'ts of interaction design
- What to provide and what not to provide at the interface
- Derived from a mix of theory-based knowledge, experience and common-sense

Visibility principle

- Visibility

- A control should be visible so users know it is available
- Should provide immediate feedback to indicate it is responding

www.ru.is

Feedback

- Sending information back to the user about what has been done
 - Equally important to indicate failure and success
- Includes sound, highlighting, animation and combinations of these
 - e.g. when screen button clicked on provides sound or red highlight feedback:

Previous → "ccclchhk"

Previous → Previous

www.ru.is

Constraints

- Restricting the possible actions that can be performed
- Helps prevent user from selecting incorrect options
- Physical objects can be designed to constrain things
 - e.g. only one way you can insert a key into a lock

www.ru.is

Consistency

- Design interfaces to have similar operations and use similar elements for similar tasks
- Main benefit is consistent interfaces are easier to learn and use
- Inner consistence – within the system
 - To make it easy for the user to user actions that they have not used before.
- Outer consistence – With other systems
 - Exploiting prior knowlegde
 - Also knowlegde of other equipment f.x. Calculator

www.ru.is

Affordance principles

- Affordance
 - The appearance of any control should suggest its functionality

www.ru.is

Web Design

www.hr.is

Web Design

Three specific areas:

1. Designing the structure
 - According to the user's goals
 - The grouping of information is very important
2. Helping users know where they are
 - E.g. on the web, the logo is placed in the upper left hand corner
3. Helping users navigate

These three areas are all taken into consideration even while designing low fidelity prototypes

www.ru.is

1. Designing the structure

What is the web site supposed to communicate?

- Content rich
- Web application

Need for structure

- What is on each page?
- The layout on each page?
- Where the things are placed?

www.hr.is

For content rich web sites content is king

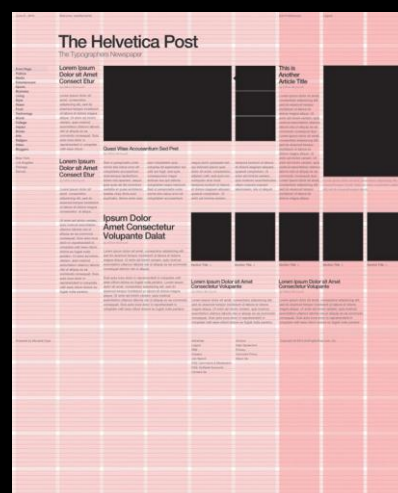

- Structure of the website is directed by the structure of the content
 - Information science
 - Taxonomy
- Content matters in SEO (leitarvélabestun)
- An example of content put in the driver's seat:
 - <https://www.gov.uk/>

www.ru.is

Grid

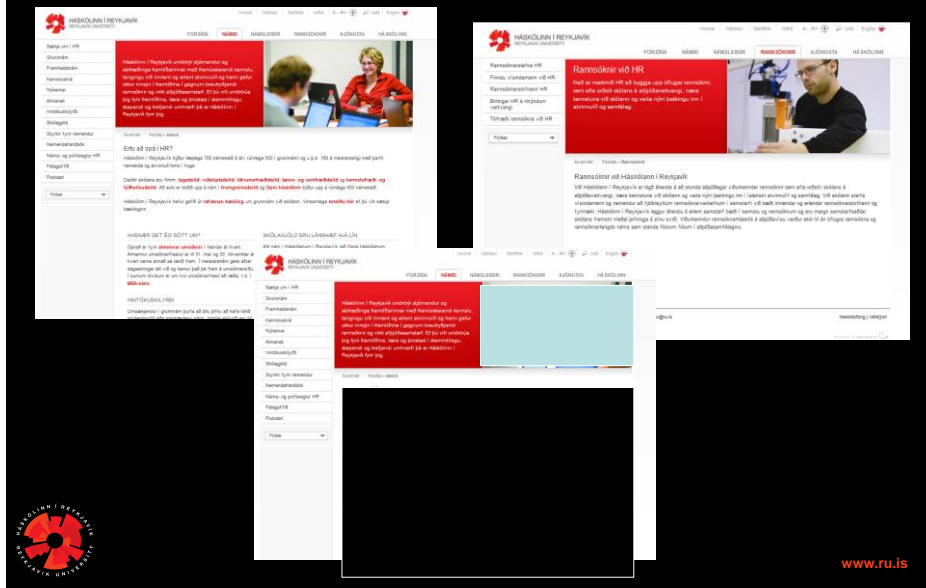

- Using a grid based layout helps structure and organize the content
- Also real handy for responsive design
- More:
 - <https://www.creativebloq.com/design/grid-based-web-design-beginners-guide-9107116>

www.ru.is

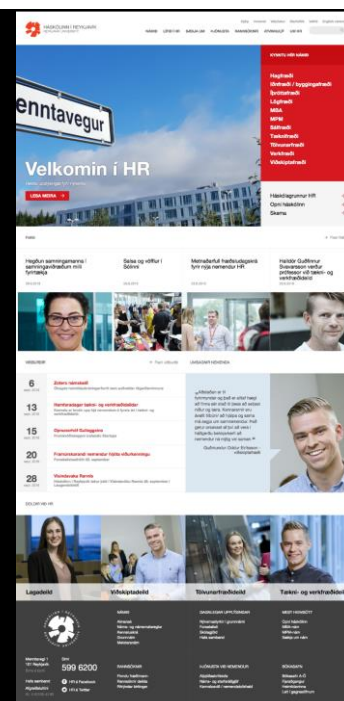

Consistent Layout

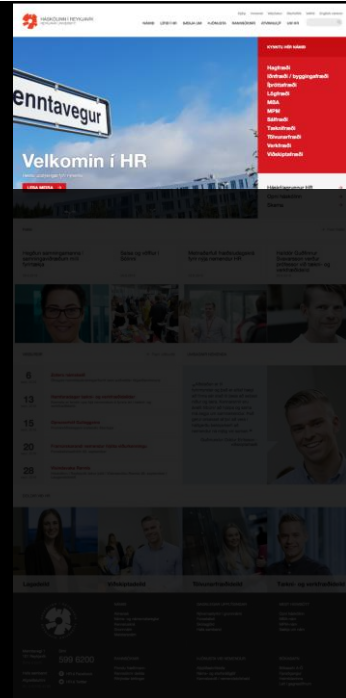

„Home page“ design

- The front page of the web, unique from the rest of the site
- Two main goals
 - Tell the user where he/she is
 - Tell the user what is on the web
- Most of the web site have:
 - The organization's logo
 - The name of the organization
 - Short introduction of the purpose of the organization/website
 - Access to most important tasks
 - Some sort of navigation aids
 - Search

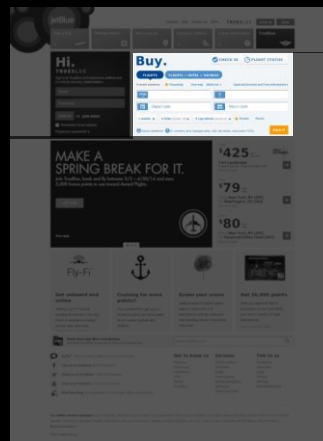

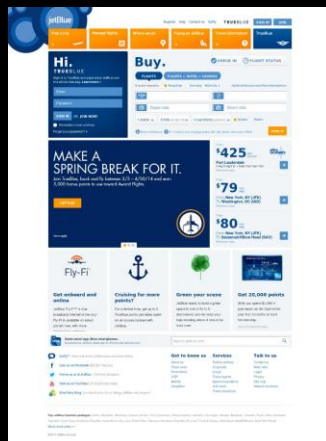

Below the fold

- The whole home page is not visible when you open it
- Anything that is not immediately visible is called “below the fold”
 - Indicate that there is more
- Above the fold content is the most important content
 - Scrolling very common, if people know there is more to come

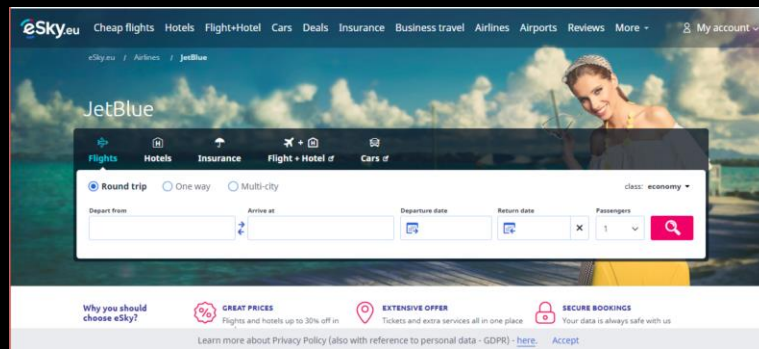

One track mind

- The way you see your website
- The way your users see your website

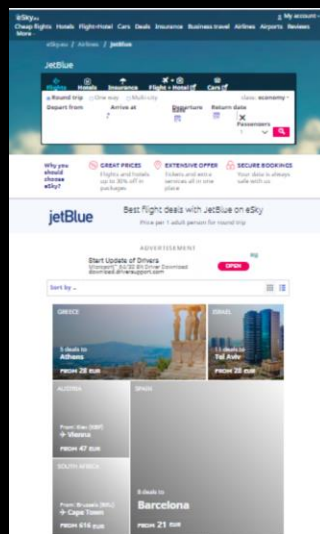

www.ru.is

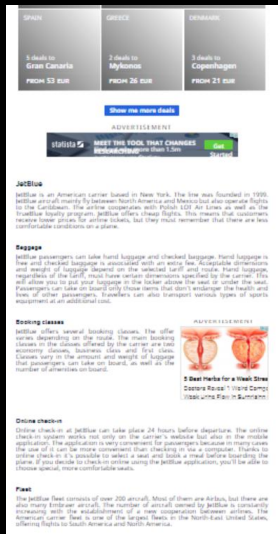

Now the Design is Different

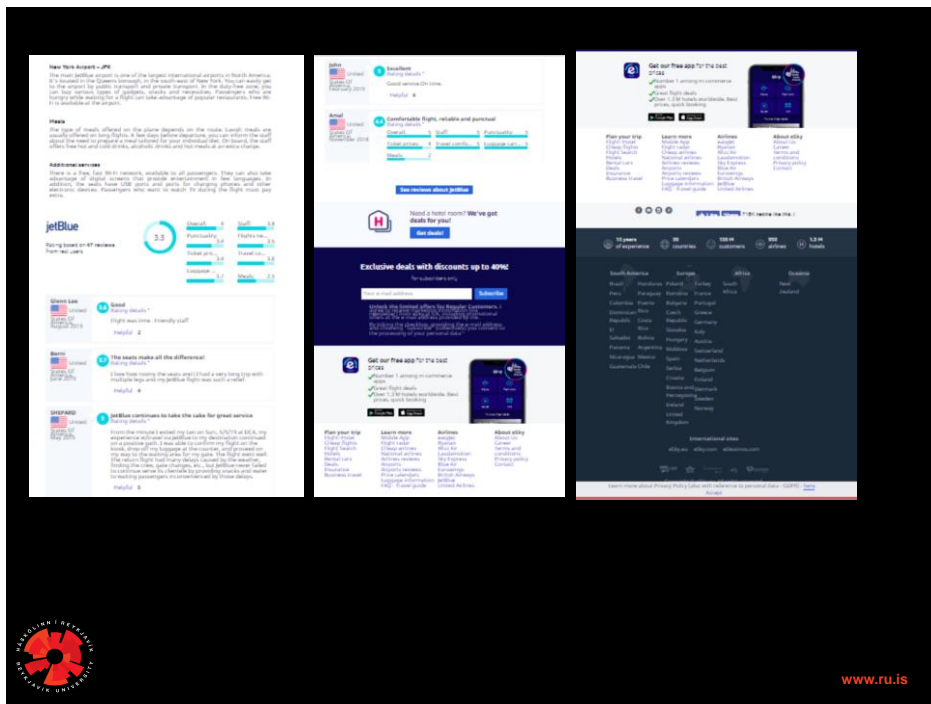

www.ru.is

www.ru.is

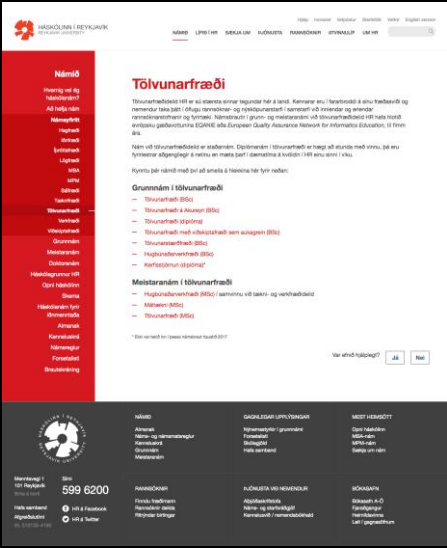

Designing Interior Pages

- Getting to the purpose of the website
- More content
- Common features
 - Menu
 - Header and footer from the first page
 - Unless it distracts from the task
- Consistency is key
- Also consider sectional pages (milli-forsíður)

Sectional pages

The screenshot shows the website of Háskólinn í Reykjavík (University of Applied Sciences in Reykjavík). The page is titled 'Tölvunarfræði' (Computer Science). The sidebar on the left contains a list of navigation links. The main content area includes a description of the department and a list of links to various resources. The footer contains contact information, including a phone number (599 6200) and social media links.

Smart phones and pads

- People expect to be able to access any website on their smart phone or pad.
- To design for these different screen sizes is tricky
 - Endless resolution considerations...
 - A consideration for all software, be it content sites or apps.
 - Mouse/keyboard vs finger
- All about tradeoffs
 - Different constraints

Steve Krug (Don't make me think, 2014):
Managing real estate challenges **shouldn't**
be done at the cost of usability

Designing for different screen sizes

- Two opposing schools of thought:
 - **Repurposing**: make as few designs as possible — preferably only one — and reuse the same material across as many platforms as possible (*responsive design*).
 - **Platform optimization**: design different user interfaces for each main platform, integrating the user experience layers as tightly as possible.

• <http://www.nngroup.com/articles/repurposing-vs-optimized-design/>

www.ru.is

Responsive design

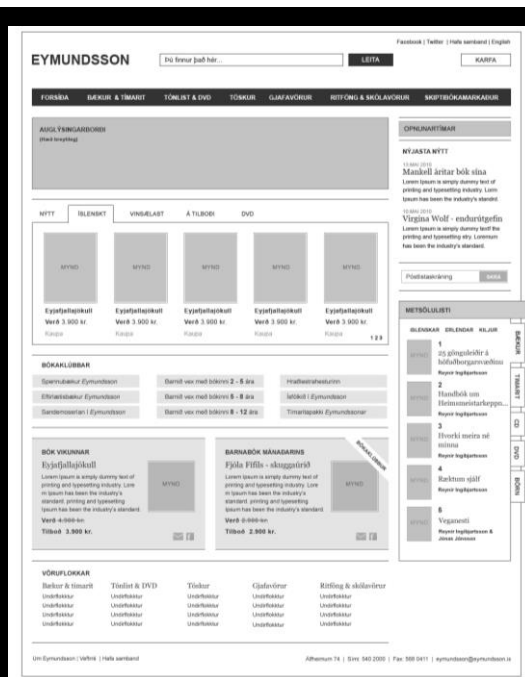

- Design for different screen sizes
 - One codebase
 - Breakpoints
 - Smooth transitions
- Easier to maintain
- Sacrifices the capabilities of the operating system
 - Location
 - Notifications

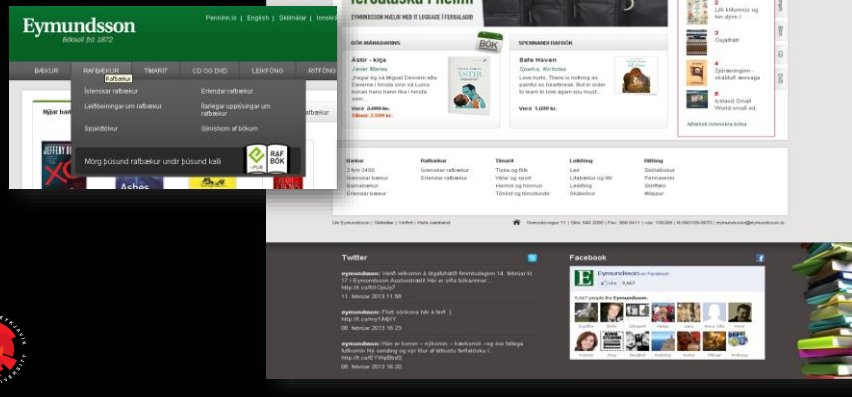

New Design

- First designed by a new wireframe
- New structure
 - Page – users tasks
 - Menu tree

In Detail

- New webtree shown in megamenu

2. Help Users Know Where They Are

www.hr.is

Know Where You Are

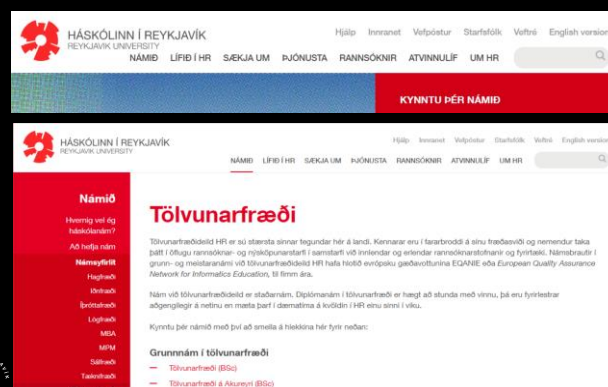

- Sometimes users jump directly to a page
 - A search may bring them deep into the website
 - How can they know where they are, the context of the information they are looking at?
- Breadcrumbs / Menu indicators
 - Shows where the information has been classified on the website.

www.ru.is

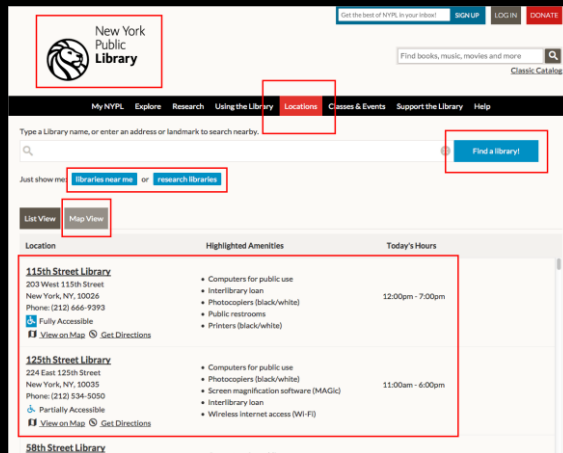

Help Users Know Where They Are

- Allow users to find the home page
 - Logo in the top left hand corner
 - Include the name of the organization

www.ru.is

3. Helping Users Navigate

From: <https://www.nngroup.com/articles/navigation-you-are-here/>

www.hr.is

3. Helping Users to Navigate around the Site

- Navigational aids
 - How do we get there?
 - Some of navigation aids
 - Menus
 - Links
 - Header and Footer
 - Breadcrumbs
- Navigation design
 - What belongs where and with what?

www.ru.is

Navigation aids in content

- **Menus**

- The first place people look to understand what is included on the site. Important for situational context. Many users do not land on the homepage, so orientation is essential.

- **Links**

- Help users make connections between related content.
 - <http://www.freshconsulting.com/navigation-ui-design/>

- **Header and Footer**

- Information-heavy sites can be made manageable with grouping of information

- **Breadcrumbs**

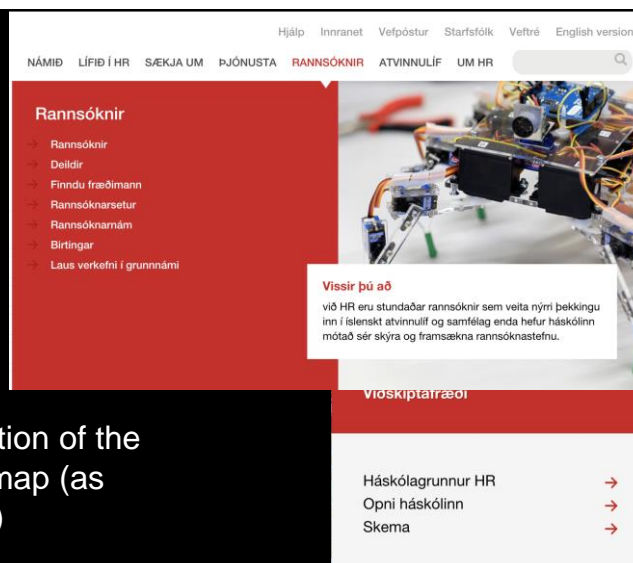

- Like chapter headings in a book, breadcrumbs give situational context.

www.ru.is

Navigation aids: Menus

- Representation of the navigation map (as appropriate)

www.ru.is

Navigation aids: Links

- Three types of links
 - “Structural navigational links”
 - Reflect the structure of the web site
 - Direct users to other parts of the web
 - “Associative links” (bookmarks)
 - Group the information within the page
 - Direct users to other parts of the same page
 - “See also” links
 - Direct users to related content

www.ru.is

Navigation aids: Links

- What words should we use?
 - Which is better:
 - “Visiting?”
 - “How to find us”
- Instead of link we can use:
 - Button
 - Selectable graphical images
 - Drop-down lists
- Guidelines
 - www.usability.gov

www.ru.is

Navigational aids: Header and footer

- Header
 - Top level navigation

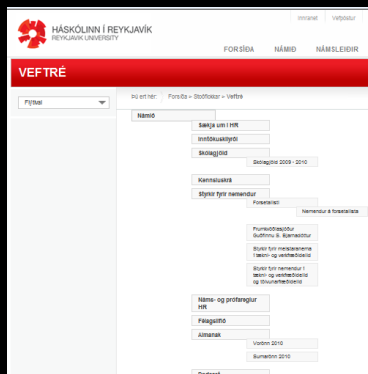

- Footer
 - Allow direct access to common content needs

www.ru.is

More navigational aids

- Site map

- Breadcrumbs

- Map

www.ru.is

The screenshot shows the BBC News homepage. Annotations are as follows:

- (1) Points to the BBC logo and branding.
- (2) Points to the navigation bar (News, Sport, Weather, Shop, Earth, Travel, More).
- (3) Points to the 'Technology' sub-heading.
- (4) Points to the article title 'Intelligent Machines: The jobs robots will steal first'.

Below the article title, the byline reads 'By Jane Wakefield, Technology reporter' and the date '14 September 2015'. The article features a blue-tinted image of people in a futuristic setting. To the right, there are sections for 'Top Stories' (Hungary enacts tough migrant laws, Australia set to swear in new PM, Russia plans Syria air base) and 'More like this' (How to speak AI, Look no hands: Self-driving cars, How to robot-proof your career).

BBC News indicates where you are with (1) logo and branding, (2) navigation-bar change, (3) headings, and (4) contextual cues. The page title and URL include the article's title and website's name.

From: <https://www.nngroup.com/articles/navigation-you-are-here/> www.ru.is

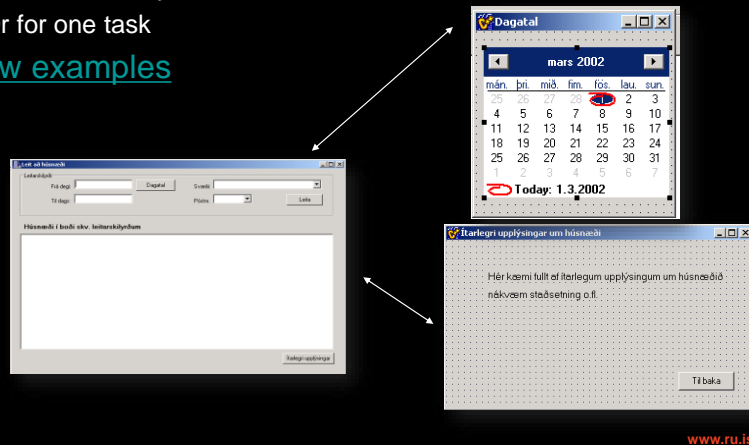

Navigation Design

The graphic features a wooden signpost with three arrows pointing in different directions. The top arrow points right and says 'NAVIGATION'. The middle arrow points left and says 'is like a'. The bottom arrow points right and says 'road sign.' To the right of the signpost is a collage of website navigation elements, including the ASOS website (The Online Fashion Store), the CNN.com/entertainment website, and a 'FREELANCE SWITCH' button.

<https://www.nngroup.com/articles/navigation-you-are-here/> www.hr.is

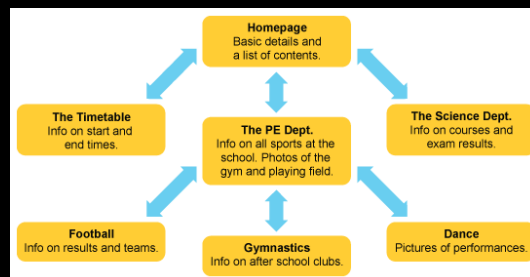

Navigation design (Navigation diagrams/Site maps)

- Shows how you travel from one window to another
 - For the whole system
 - Or for one task
- A few examples

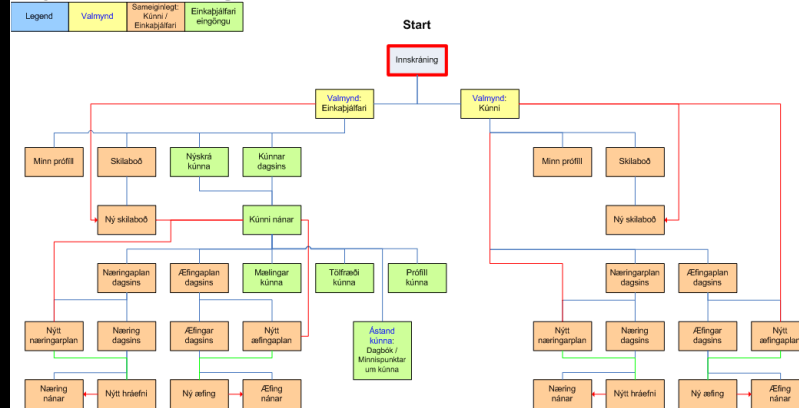

Some examples of navigation diagrams

- Good to show arrows
- Good to show various access
- Good to mark what is the main window
- Good to put a legend of what means what

Different Access

PhysicalLink Navigational Map

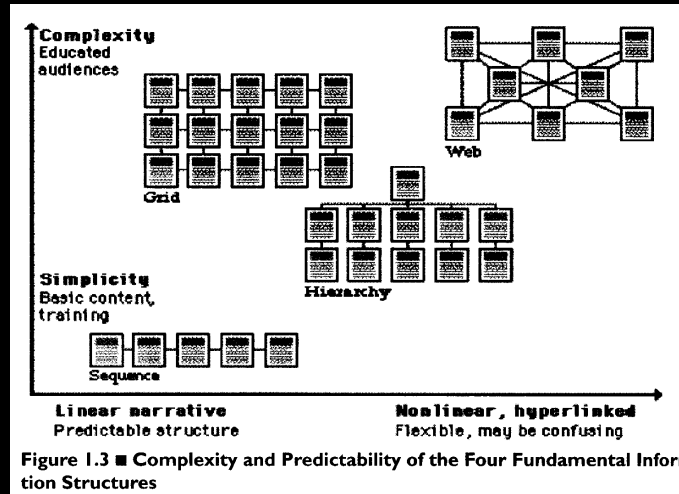

www.ru.is

Can be used to evaluate the structure

www.ru.is

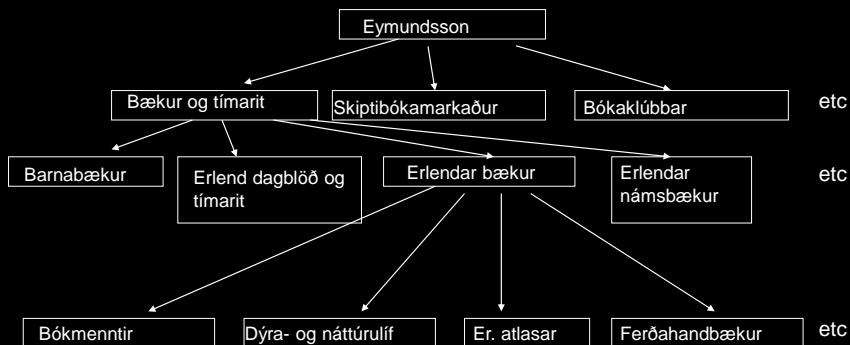

The look of the navigation diagrams

www.ru.is

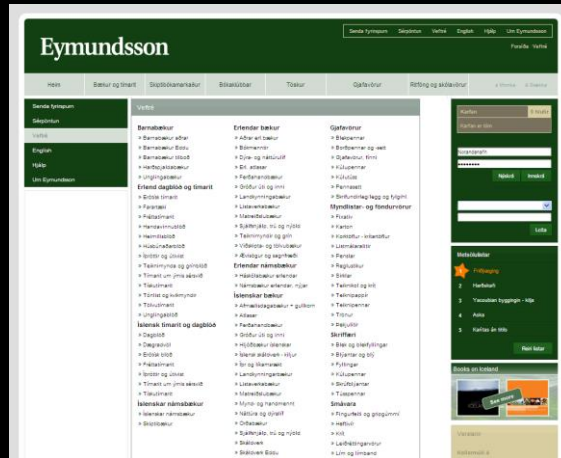

To group the information – make a site map

- Look at the normal grouping of information

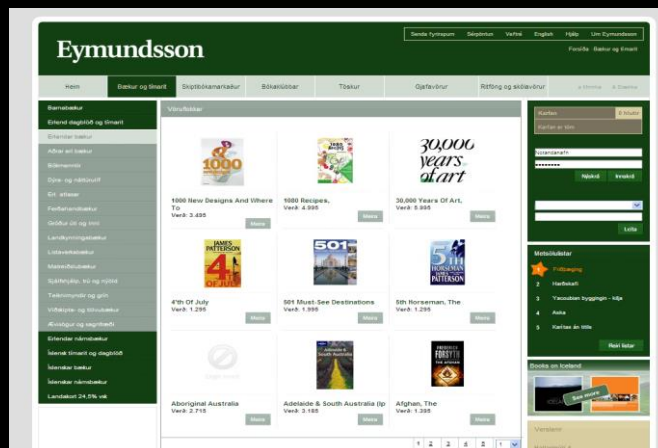

www.ru.is

Was displayed this way

www.ru.is

The grouping is to the left,
easier direct access to content

www.ru.is

Then we have many questions

- How deep and wide should the web tree be?
 - Often better to have rather wide than deep
 - Mega menus, show 2-3 levels at a time – very good to orient the user quickly
- Is it better to divide a block of information into several short pages or leave it as one long page?
 - Consider context and continuity
 - Load time in the beginning, but not in between
 - Keep together it naturally belongs together

www.ru.is

More questions

- Is it ok to combine pages?
 - For example information on many books on the same page?
 - If the information is related then, yes
 - Use of tabs very popular, gives us a shallower site sometimes
 - Pagination vs. continuous scrolling
- Does the structure of the site reflect the structure of the tasks the users want to carry out?
 - Look at what books are available – Browsing
 - Look for a particular book – Searching
 - The structure needs to support both
 - Should not reflect the internal organization of the company
